FACILITATOR FIELD GUIDE / 2 FACILITATORS / 180 MINUTES

My first AI agent

Anton leads demonstrations. Ondra records expectations and helps with access. Both consult during independent work. Presentation is for projection; Exercises contains copy-ready prompts for participants' own apps.

Beforehand: check accounts, tools, projector, Qwen and weather. Facilitator → Model connection: this browser remembers saved details. Prepare the original prompt, plugin and fallback HTML. Leave the plugin uninstalled for the demo if desired. Open the participant QR.

00-15	Welcome and expectations	Name, experience with AI, one expectation. Ondra records.
15-30	How agents work	App ↔ model; app ↔ tools. Result → another model call.
30-45	Řevnice right now	Without tool → with tool → walking goal. Source and time.
45-65	Define the problem	What, why, for whom and where. Then explore solutions with AI.
65-75	Break	B helps with access; A prepares the next demonstration.
75-95	Safety and creation	5 min safety, 3 terms, 5 creation, 2 result, 5 choosing a route.
95-135	BUILD · 40 min	Own application. Check at 10 / 25 / 40 min. Both consult.
135-165	TEST · 30 min	Normal task, changed constraint, injected instruction. Fix/retest.
165-180	Handover	One minute each, save work, revisit expectations.

EXPLANATION AND DEMOS

One idea per slide; details under Facilitator → Notes. Chat / workflow / agent: who chooses the next step? Build the house from its foundations. The diagram separates model, app and tools; results lead to another call. Use the decision tree rather than forcing an agent. Check weather source, location and time. Start the presentation demo with the human prompt: AI wrote the code. Tabs: prompt / installation / result / files.

BRIEF AND 70 MINUTES OF PRACTICE

Start with the problem, reason, people and context. The person names decisions to retain. Agree outputs, tools and checks with AI after choosing a solution. Exercises → Describe the problem → Design and build → Test. No GitHub or ZIP needed. Example ideas are in Exercises, not the opening. 10 min agreed solution; 25 min real run; 40 min output. Before each test write expectations, then record results, fix and retest.

SAFETY AND GOTCHAS

Public or fictional data. A local file can go to a remote model. Check training, retention and connector transfers separately. The app enforces permissions; source instructions cannot expand them. Reading / drafting / sending are distinct permissions. No account: pair up. Outage: walk the diagram or labelled sample; never fake execution. If late, shorten explanation. SDK/API and n8n are for people already set up; API credit is not a chat subscription.

CONTROLS AND CLOSING

Presentation / Exercises are the two main areas. Arrows change slides; Programme selects a section. Demos open over the slide; Esc closes them. Starting the weather demo shows diagram, step and answer together. Pause controls display, not execution. Timers continue when opening Exercises, not after changing slides. QR: Facilitator → Participant link. Notes are visible on the projector! Save the brief, instructions, output, tests and limits in your own app.
