FACILITATOR FIELD GUIDE / 2 FACILITATORS / 180 MINUTES

My first AI agent

Anton leads demonstrations. Ondra records expectations and helps with access. Both consult during independent work. Presentation is for projection; Exercises contains copy-ready prompts for participants' own apps.

Beforehand: check accounts, tools, projector, Qwen and weather. Facilitator → Model connection: this browser remembers saved details. Prepare the original prompt, plugin and fallback HTML. Leave the plugin uninstalled for the demo if desired. Open the participant QR.

00-10	Welcome and expectations	30 s each: name, experience, expectation. Ondra records.
10-25	How agents work	App ↔ model; app ↔ tools. Result → another model call.
25-35	Řevnice right now	2 min without tool, 3 with tool, 3 goal, 2 discussion.
35-50	Define the problem	3 min introduction, 7 brain dump (write/dictate), 5 AI consultation.
50-60	Break	B helps with access; A prepares the next demonstration.
60-75	Safety and creation	4 min safety, 3 terms, 5 creation with result, 3 choosing a route.
75-115	BUILD · 40 min	Own application. Check at 10 / 25 / 40 min. Both consult.
115-145	TEST · 30 min	Normal task, changed constraint, injected instruction. Fix/retest.
145-180	Save and share	2 min saving, 30 sharing (15 × 2 min), 3 reflection.

EXPLANATION AND DEMOS

One idea per slide; details under Facilitator → Notes. Chat / workflow / agent: who chooses a step? Start the house at its foundations; stairs mean connections, not a fixed sequence. The diagram separates model, app and tools; results lead to another call. Use the decision tree rather than forcing an agent. Check weather source, location and time. Start the presentation demo with the human prompt: AI wrote the code. Tabs: prompt / installation / result / files.

BRIEF AND 70 MINUTES OF PRACTICE

Start with problem, reason, people and context. Offer a brain dump: write or dictate freely into their own chat; check the transcript and organise it with AI. Questions are prompts. People retain their chosen decisions. Agree outputs, tools and checks with AI after choosing a solution. Exercises → Describe → Design and build → Test. No GitHub or ZIP needed. 10 min agreed brief; 25 min first run; 40 min output. Record expectations, actual results, a fix and a retest.

SAFETY AND GOTCHAS

Own documents require permission and a suitable service; anonymise if unsure. Passwords/keys go in connection settings, not prompts. Local files may go to the cloud. Check training, retention and connector transfers. The app enforces permissions; source instructions cannot expand them. Reading / drafting / sending are distinct. No account: pair up. Outage: diagram or labelled sample, never fake execution. If late, shorten explanation. SDK/n8n only for people already set up.

CONTROLS AND CLOSING

Arrows: house/loop steps, then slides; Programme: sections. Demos overlay slides; Esc closes. Weather shows diagram, step and answer together. Pause controls display, not execution. Timers continue in Exercises, not after changing slides. QR: Facilitator → Participant link. Notes are visible on the projector! Save brief, instructions, output and tests. Each person has 2 min including handover; Ondra keeps time. No need to project private results: share the problem, lesson and next step. Longer questions after the round.
