FACILITATOR FIELD GUIDE / 2 FACILITATORS / 180 MINUTES

My first AI agent

A leads the story and projection. B records expectations, keeps time and helps with access. Both consult during building. The facilitator controls the portal; participants create directly in their own application.

Beforehand: check accounts/tools, projector, Qwen + weather and presentation skill. In Pages enter your key; Forget after the demo. Leave the plugin uninstalled for the demo if desired. Download ZIP, A4 and labelled fallback HTML; prepare a whiteboard.

00-15	People and needs	Names, experience scale, one need. B records expectations.
15-30	How agents work	App ↔ model; app ↔ tools. Result → another model call.
30-45	Řevnice right now	Without tool → with tool → walking goal. Source and time.
45-65	A one-page brief	5 min problem, 10 min own brief, 5 min narrow with facilitators.
65-75	Break	B helps with access; A prepares the next demonstration.
75-95	Data, safety, skill	5 min safety; 10 min creation/use; 5 min terms and routes.
95-135	BUILD · 40 min	Own application. Check at 10 / 25 / 40 min. Both consult.
135-165	TEST · 30 min	Normal task, changed constraint, injected instruction. Fix/retest.
165-180	Handover	One minute each, save work, revisit expectations.

STORY AND LIVE DEMOS

Need → brief → design → run → test → use. The agent chooses its next step from results; the app holds context, executes tools and enforces stopping. Without evidence, “I don’t know” is correct. Show weather source and time; Open-Meteo is an estimate. Start the presentation with the original prompt: AI wrote the code. Then installation, four brief questions, file, validation and repair. Label fallback HTML as prepared.

BRIEF AND 70 MINUTES OF PRACTICE

Brief: user, problem, goal, inputs, output, independent decisions, boundaries and testable success. Would chat or workflow suffice? Do not force an agent. No code: paste start-here.txt in a chat. Own idea: create-agent.md + brief.md + instructions.md + sources. 10 min: brief/tools; 25 min: output; 40 min: ready to test. Test in a fresh run; test-record.md: expectation → actual result → fix → retest.

SAFETY AND GOTCHAS

Public or fictional data. A local file can go to a remote model. Check training, retention and connector transfers separately. The app enforces permissions; source instructions cannot expand them. Reading / drafting / sending are distinct permissions. No account: pair up. Outage: walk the diagram or labelled sample; never fake execution. If late, shorten explanation. SDK/API and n8n are for people already set up; API credit is not a chat subscription.

CONTROLS AND TAKEAWAY

“Present demo”: diagram, highlighted step and actual answer together. Stepping and pause control display, not execution; replay makes no API calls. Esc returns to the lesson. Work blocks have a visible timer. Notes and settings are visible on the projector! CZ/EN in the header. Success: saved brief + instructions/skill + output + 3 tests + limits. Ask: who chooses steps, who executes and where are the boundaries? The portal does not collect participant work.
